, thermal processing of ITZ and HPMC by both hot-melt extrusion (HME) and KinetiSol was investigated.. These researchers found that ITZ:HPMC E5 (1:2) amorphous solid dispersions produced by HME were two-phase systems; whereas, the same composition processed by KinetiSol yielded a single-phase amorphous dispersion.. The dissolution result correlated with the results of mDSC in that the dissolution rate of the more homogenous KinetiSol system would be governed primarily by the hydrophilic polymer, while the heterogeneous HME system containing drug rich, hydrophobic domains would dissolve more slowly. Itraconazole: Physicochemical Properties Indication Anti-fungal Melting Point 170C Solubility 0.02C for the KinetiSol product and two distinct T g s for the melt extruded product.. This study established the unique ability of KinetiSol to process thermally sensitive, highly viscous polymers without use of a plasticizer with a resulting improvement in physical stability of the amorphous dispersion end product.. The solubility in 0.1N HCl is approximately 4-6 gmL and in water is 1-4 ngmL Itraconazole exhibits very poor oral bioavailability owing to its insolubility in intestinal fluids.. Finally, KinetiSol was able to homogenously process a highly viscous, cross-linked polymer into an amorphous dispersion without use of a plasticizer opening new possibilities for the use of cross-linked materials for solubility enhancement applications.
